Language Basics

Compilation Steps

A C++ source file transforms through several stages to become an executable program:

- 1. **Character Translation**: Source characters are translated to the source character set. Trigraph sequences are converted, and end-of-line sequences are replaced by newlines.
- Backslash Handling: Backslashes followed by newlines are removed, except in universal characters or at the file's end. This can extend preprocessor directives or comments.
- 3. **Tokenization**: The source is divided into preprocessor tokens, including header names, identifiers, and literals.
- 4. **Preprocessing**: Macros are expanded, and #include files are processed.
- 5. Literal Conversion: Character and string literals are converted to the execution character set.
- 6. **String Concatenation**: Adjacent string literals are concatenated, with errors for mixing narrow and wide types.
- 7. Main Compilation: The source undergoes the primary compilation process.
- 8. File Combination: Compiled files are combined, with template instantiations identified and compiled.
- 9. Linking: External references are resolved, and compiled files are linked to create an executable.

Tokens

Source code is divided into a stream of tokens, adhering to the "max munch" rule, where the compiler collects as many characters as possible for a valid token. Tokens include identifiers, keywords, literals, and symbols.

The differences between a preprocessor token and a compiler token are small:

- The preprocessor and the compiler might use different encodings for character and string literals.
- The compiler treats integer and floating-point literals differently; the preprocessor does not.
- The preprocessor recognizes <header> as a single token (for #include directives); the compiler
 does not.

Identifiers

Identifiers are names defined by the programmer or in libraries. They begin with a nondigit (letter, underscore, or universal character) and are followed by any combination of digits and nondigits. Restrictions include:

- Double underscores (___) or an underscore followed by an uppercase letter are reserved.
- Identifiers starting with an underscore are reserved in the global namespace.

Keywords

Keywords are reserved identifiers for language use, such as int, return, class, etc. Some compilers may allow certain keywords as identifiers.

C++ Keywords

This table lists some of the keywords in the C++ programming language.

Keyword	Description
and	Logical AND operator
and_eq	Bitwise AND assignment operator
asm	Keyword for inline assembly code
auto	Keyword to declare a variable with automatic storage duration
bitand	Bitwise AND operator
bitor	Bitwise OR operator
bool	Keyword for boolean data type
break	Keyword to exit a loop or switch statement
case	Keyword used in switch statements
catch	Keyword for exception handling (catch block)
char	Keyword for character data type
class	Keyword to define a class (user-defined data type)
compl	Bitwise complement operator
const	Keyword to declare a constant variable
const_cast	Cast that removes const-ness
continue	Keyword to skip to the next iteration in a loop
default	Keyword used in switch statements (default case)
delete	Keyword to deallocate memory
do	Keyword to introduce a do-while loop
double	Keyword for double-precision floating-point data type
dynamic_cast	Runtime cast operator
else	Keyword used for conditional statements
enum	Keyword to define an enumerated data type
explicit	Keyword to specify a constructor must be called explicitly
export	Keyword used for exporting symbols (C++)
extern	Keyword to declare a variable or function defined elsewhere
	5/0

float Keyword for single-precision floating-point data type for Keyword to introduce a for loop friend Keyword to declare a friend function or class goto Keyword for jumping to a labeled statement (not recommended) if Keyword for conditional statements inline Keyword to suggest inlining a function int Keyword for long integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) public Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword to declare a signed integer signed Keyword to declare a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	Keyword	Description
for Keyword to introduce a for loop friend Keyword to declare a friend function or class goto Keyword for jumping to a labeled statement (not recommended) if Keyword for conditional statements inline Keyword to suggest inlining a function int Keyword for integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (protected access) protected Access specifier for class members (protected access) protected Access specifier for class members (protected access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to declare a signed integer static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	false	Keyword for boolean false value
friend Keyword to declare a friend function or class goto Keyword for jumping to a labeled statement (not recommended) if Keyword for conditional statements inline Keyword to suggest inlining a function int Keyword for long integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator or_eq Bitwise OR assignment operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (private access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to declare a signed integer sizeof Keyword to declare a signed integer static Keyword to declare a variable or type static Keyword to define a structure data type static Keyword to define a structure data type static Keyword to define a structure data type	float	Keyword for single-precision floating-point data type
goto Keyword for jumping to a labeled statement (not recommended) if Keyword for conditional statements inline Keyword to suggest inlining a function int Keyword for integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (private access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to declare a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	for	Keyword to introduce a for loop
inline Keyword for conditional statements inline Keyword to suggest inlining a function int Keyword for integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to declare a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	friend	Keyword to declare a friend function or class
inline Keyword to suggest inlining a function int Keyword for integer data type long Keyword for long integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator or Logical OR operator or Logical OR sassignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Keyword to return a value from a function keyword to declare a signed integer sizeof Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	goto	Keyword for jumping to a labeled statement (not recommended)
int Keyword for integer data type mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Keyword to return a value from a function short Keyword to declare a signed integer sizeof Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type struct Keyword to define a structure data type	if	Keyword for conditional statements
New	inline	Keyword to suggest inlining a function
mutable Keyword to declare a member of a const class that can be modified namespace Keyword to define a namespace new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword to declare a signed integer signed Keyword to declare a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	int	Keyword for integer data type
namespace New Keyword to allocate memory Not Logical NOT operator Not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	long	Keyword for long integer data type
new Keyword to allocate memory not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword to declare a signed integer sizeof Keyword to declare a variable with static storage duration static Cast that performs safe type conversions struct Keyword to define a structure data type	mutable	Keyword to declare a member of a const class that can be modified
not Logical NOT operator not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	namespace	Keyword to define a namespace
not_eq Bitwise NOT-equal operator operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	new	Keyword to allocate memory
operator Keyword to define overloaded operators or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	not	Logical NOT operator
or Logical OR operator or_eq Bitwise OR assignment operator private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	not_eq	Bitwise NOT-equal operator
private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	operator	Keyword to define overloaded operators
private Access specifier for class members (private access) protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	or	Logical OR operator
protected Access specifier for class members (protected access) public Access specifier for class members (public access) register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	or_eq	Bitwise OR assignment operator
publicAccess specifier for class members (public access)registerKeyword to suggest keeping a variable in a register (compiler-dependent)reinterpret_castCast that can perform any type conversionreturnKeyword to return a value from a functionshortKeyword for short integer data typesignedKeyword to declare a signed integersizeofKeyword to get the size of a variable or typestaticKeyword to declare a variable with static storage durationstatic_castCast that performs safe type conversionsstructKeyword to define a structure data type	private	Access specifier for class members (private access)
register Keyword to suggest keeping a variable in a register (compiler-dependent) reinterpret_cast Cast that can perform any type conversion return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	protected	Access specifier for class members (protected access)
return Keyword to return a value from a function short Keyword for short integer data type signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	public	Access specifier for class members (public access)
return Keyword to return a value from a function Keyword for short integer data type Signed Keyword to declare a signed integer Sizeof Keyword to get the size of a variable or type Static Keyword to declare a variable with static storage duration Static_cast Cast that performs safe type conversions Struct Keyword to define a structure data type	register	Keyword to suggest keeping a variable in a register (compiler-dependent)
signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	reinterpret_cast	Cast that can perform any type conversion
signed Keyword to declare a signed integer sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	return	Keyword to return a value from a function
sizeof Keyword to get the size of a variable or type static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	short	Keyword for short integer data type
static Keyword to declare a variable with static storage duration static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	signed	Keyword to declare a signed integer
static_cast Cast that performs safe type conversions struct Keyword to define a structure data type	sizeof	Keyword to get the size of a variable or type
struct Keyword to define a structure data type	static	Keyword to declare a variable with static storage duration
	static_cast	Cast that performs safe type conversions
switch Keyword to introduce a switch statement	struct	Keyword to define a structure data type
	switch	Keyword to introduce a switch statement

Keyword	Description
template	Keyword to define function or class templates (C++)
this	Keyword to refer to the current object
throw	Keyword to throw an exception
true	Keyword for boolean true value
try	Keyword for exception handling (try block)
typedef	Keyword to create an alias for an existing type
typeid	Keyword to get the type information of an expression
typename	Keyword used in template metaprogramming
union	Keyword to define a union data type
unsigned	Keyword to declare an unsigned integer
using	Keyword to introduce a using declaration
virtual	Keyword to declare virtual functions (C++)
void	Keyword for the void data type (no value)
volatile	Keyword to declare
wchar_t	Keyword for wide character type
while	Keyword for while loops
xor	Keyword for bitwise XOR operation
xor_eq	Keyword for bitwise XOR assignment

Literals

- Integer Literals: Can be decimal, octal, or hexadecimal with optional suffixes (U, L). For example, 314, 0xFeeL.
- Floating-point Literals: Have an integer part, decimal point, and exponent. Types are double, float (F), or long double (L).
- Boolean Literals: true and false.
- Character Literals: Enclosed in single quotes, prefixed with L for wide characters (e.g., L'x').

Table: Character escape sequences

Escape Sequence	Meaning
\\	\ character
\ 1	' character
/"	" character

Escape Sequence	Meaning
\?	? character (used to avoid creating a trigraph)
\a	Alert or bell
\b	Backspace
\f	Form feed
\n	Newline
\r	Carriage return
\t	Horizontal tab
\v	Vertical tab
\000	Octal number of one to three digits
\xhh	Hexadecimal number of one or more digits

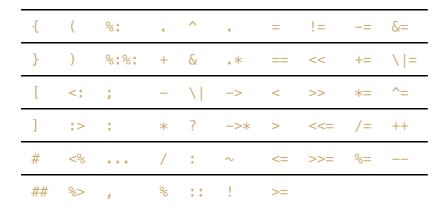

• **String Literals**: Enclosed in double quotes, with L for wide strings. Adjacent strings are concatenated at compile time.

Escape sequences are used in character and string literals, such as \n for newline or \\ for a backslash.

String literals have a type of const char[] or const wchar_t[] and can be converted to pointers.

Symbols

Nonalphabetic symbols are used as operators and as punctuation (e.g., statement terminators). Some symbols are made of multiple adjacent characters. The following are all the symbols used for operators and punctuation:

- **No Whitespace in Symbols**: You cannot insert whitespace between characters that make up a symbol. C++ will collect as many characters as it can to form a symbol before interpreting it. For example, x+++y is read as x ++ + y.
- **Template Instantiation**: A common error is omitting a space between closing angle brackets in nested template instantiation. Example:

```
std::list<std::vector<int> > list;
```

Note: The space between > is crucial. Without it, >> would be interpreted as a right-shift operator, not two separate closing angle brackets

```
::std::list< ::std::list<int> > list;
```

Note: Spaces are needed between the angle bracket < and the scope operator ::. This prevents the compiler from misinterpreting <: as an alternative token.

Comments

Comments start with /* and end with */. These comments do not nest. For example:

```
/* this is a comment /* still a comment */
int not_in_a_comment;
```

A comment can also start with //, extending to the end of the line. For example:

```
const int max_widget = 42; // Largest size of a widget
```

Within a /* and / comment, // characters have no special meaning. Within a // comment, / and */ have no special meaning. Thus, you can "nest" one kind of comment within the other. For example:

```
/* Comment out a block of code:
const int max_widget = 42; // Largest size of a widget
*/
///* Inhibit the start of a block comment
const int max_widget = 10; // Testing smaller widget limit
//*/
```

A comment is treated as whitespace. For example, str/comment/ing describes two separate tokens, str and ing.
